Myrio Updates IP Video System

BOTHELL, Wash. -- Myrio Corporation, a leading provider of IP video software and services, today announced the commercial availability of Version 3.2 of the Myrio IP Video Platform. The latest release of Myrio's IP video platform enables broadband service providers to increase operational efficiencies when deploying IP-based video and interactive services. In addition, the new version is easier for operators to use, adapts to their unique markets, and improves system management.

Amino Communications' AmiNET110 is the first STB certified for deployment with the new release utilizing the recently launched Myrio Interactive Development Kit (iDK), which gives broadband service providers additional choice in STB vendors.

The release of Version 3.2 improves upon both of Myrio's highly successful core products, TotalManage(TM), the back-office subscriber and content-management application, and Myrio Interactive(TM), the full-featured end-user application. TotalManage(TM) equips broadband service providers with tools that facilitate greater choice in hardware, allowing service providers to streamline operations and system management and, ultimately, lower the total cost of operations. By equipping consumers with a more intuitive user interface and more robust STBs, Myrio Interactive provides greater choice, convenience and control within the digital home.

"We continue to improve our products and services by working closely with our customers and partners," said Chris Coles, president and CEO of Myrio. "Broadband service providers and IP video vendors have been key in driving enhancements to TotalManage and Myrio Interactive. The enhancements in this release were designed to address specific revenue-generating and operational cost-saving needs, with a focus on providing the end user a more personalized experience with heightened levels of convenience, control and ease of use."
